

- 1. Create a comparison table listing at least 3 differences each between IaaS, PaaS, and SaaS, and give one real-world app example for each type (e.g., Spotify, Flipkart, etc.)**

| Feature               | IaaS                                    | PaaS                                            | SaaS                                   |
|-----------------------|-----------------------------------------|-------------------------------------------------|----------------------------------------|
| 1.What is Provides    | Virtual Servers, storage and networking | Platform/tools to develop and run applications. | Ready-to-use software/application.     |
| 2.User responsibility | User manages OS, applications and data. | User mainly manages applications and data.      | Provider manages almost everything     |
| 3.Main purpose        | Gives control over IT infrastructure    | Helps developers build and deploy apps          | Lets users directly use an application |
| 4.Technical Knowledge | Requires more technical knowledge       | Requires programming/technical knowledge        | Requires little technical knowledge    |
| 5.Real-world example  | Amazon EC2                              | Google App Engine                               | Spotify                                |

- 2. Pick any two apps you use daily (such as Zomato and Instagram) and explain in 2-3 lines how they might use cloud computing in their backend operations.**

- Zomato – Zomato uses cloud servers to store restaurant menus, user accounts and order details. Cloud computing also helps handle millions of food orders and delivery tracking requests simultaneously.
- Instagram – Instagram uses cloud computing to store and manage billions of photos, videos and user data. Cloud servers allow users to upload, view and share content quickly from anywhere.

3. Sign up for an AWS Free Tier account (use your own email/phone), log in to the AWS Management Console, and take a screenshot of your dashboard showing your account name.

4. Launch a basic EC2 instance on AWS using the Free Tier (choose t2.micro, Amazon Linux 2), and once it is running, take a screenshot of the instance details page showing its status.

5. After launching your EC2 instance, stop it from the AWS console and note the changes in its status and billing estimate.

The screenshot displays the AWS Management Console interface. At the top, a green banner indicates 'Successfully initiated stopping of i-05ea7ed7b8af42453'. The main content area shows the 'Instances' page with a table listing one instance, 'MyFirstEC2', with ID 'i-05ea7ed7b8af42453' and state 'Stopped'. Below the table, the 'Details' tab for this instance is active, showing a summary of its configuration: Instance ID, Public IPv4 address, Private IPv4 addresses, IPv6 address, Instance state, Public DNS, Hostname type, and Private IP DNS name. The instance is currently in a 'Stopped' state.
